

- India's automotive market offers **hundreds of vehicles** across different price ranges, body types, and specifications, making manual comparison difficult.
- Traditional recommendations often depend on **brand preference or dealer suggestions**, rather than the buyer's actual usage pattern.
- Buyers frequently compare vehicles from incompatible budget segments, which increases decision time and may lead to poor purchase choices.
- Few systems for Indian vehicle data translate informal preferences such as *"Family Trips"* or *"Off-roading"* into measurable technical needs.
- **AutoMatch** uses a two-stage pipeline: clean budget classification followed by personalized similarity-based ranking.
