

Literature Review – Hybrid Recommender System

Paper: Web-Based Car Recommendation System using Hybrid Algorithm

Approach

- Combines **User-to-User** and **Item-to-Item Collaborative Filtering**
- User model built from demographic data, clickstream, and browsing history
- Item profile: 40 car brands, 224 car models
- Achieves **83% recommendation accuracy**

Limitations

- Requires large user interaction data
- Suffers from cold-start issues for new users
- Harder to maintain for rapidly changing Indian car listings
