

Literature Review – Content-Based ML Approach

Paper: Machine Learning-Powered Car Recommendation System (Content-Based)

Approach

- Matches user requirements directly against vehicle feature vectors
- Uses structured specifications such as price, mileage, engine, and fuel type
- No cold-start problem because prior interaction history is not required
- Easier to implement, explain, and deploy

Limitations

- Does not learn long-term behaviour from users
- Quality depends on available structured vehicle attributes

AutoMatch follows this content-based direction and extends it with budget-tier classification, leakage-safe evaluation, and lifestyle-to-spec mapping.
