

Conclusion

- **AutoMatch** demonstrates that a two-stage ML pipeline can solve vehicle recommendation by first classifying budget tier and then ranking suitable cars.
- Random Forest provides strong budget prediction performance, while CART supports interpretability and comparison.
- The recommendation score is used only for ranking user-fit, keeping it separate from classification accuracy.

Future Scope

- Real-time dealer pricing and availability APIs
- Saved model deployment with scheduled refresh
- User feedback loop for preference refinement
- EV-specific recommendation with range and charging features
